to manually copy Logic Pro 9 files from a backup disk to a new image. I opened Logic and it asked for my serial number. I thought it was an antivirus issue. I wrote down the serial code. I included the data that I received from Logic on a new boot drive and closed Logic. Then I booted Logic from DOWNLOAD.SYSTEM into the BIOS, and at that moment there was a new message box with the Microsoft logo. I entered the serial key and installed everything as expected. But one of the last lines was a message that a Logic! user ID is required. I entered this information and Logic 9 appeared in front of me. After I tried to boot from the first Logic backup image and after the boot problem disappeared, I had the feeling that I was logging into the computer under a different name. I went back to the previous Logic boot disk after I had a few more questions. I was behind a firewall and DOS successfully loaded the new drivers. The only thing that didn't work during boot was reading from USB devices. I made changes to the USBXFra.xml config file to specify that the contents of the USB ports should be local instead of showing up in the Local Storage window. To be sure, I tried again with the same USB drive and again the USBXMR booted correctly, but was listed as non-working on the list of available hardware. The only reason I used msdos for my work was that it allowed me to run programs without having to restart my computer. So I turned it off when I decided to stop the job, but didn't turn it off automatically. Once I did that, I saw an error message: APP DRIVER LOAD REQUESTED APP DETECT COMPUTER FOR DISPLAY DEEP Require password for a Logic account NTK SCSI 2012System NT4 supports installing this app. This meant that I couldn't use Logic 8 because it now runs on a different operating system. I restored Windows XP. Also, I found a few servers that could help me download the drive
