The present invention relates to semiconductor devices, and more specifically, to phase-change memory cells having an epitaxial thermal insulator. Computers often include auxiliary memory storage devices having media on which data can be written and from which data can be read for later use. A direct access storage device (e.g. a hard disk drive) incorporating rotating magnetic disks are commonly used for storing data in magnetic form on the disk. Data is recorded on concentric, radially spaced tracks on the disk. Magnetic heads carrying read and write elements are then used to read and record data on the disk. The trend in semiconductor memory devices is toward higher-capacity, lower-cost, higher-speed, higher-density, and lower-power nonvolatile memory devices. Some nonvolatile memory devices include arrays of flash memory cells, such as NAND-type and NOR-type flash memory. However, flash memory can only be programmed in limited ways. For example, each memory cell can only be programmed to one of two data states, and has a limited lifetime due to charge leakage from the floating gate. Moreover, the array of memory cells is typically block-erasable by block erase operations. Such block erase operations typically require high voltages and long erase times to erase the array. In addition, two different voltages are typically used to program the array of memory cells—a higher voltage is used to program a selected memory cell for a program operation, and a lower voltage is used to inhibit the selected memory cell from being programmed for an inhibit operation.

Q: Highlight text string when clicked This is what I want to do. When user click on any of the text string like CompanyName, Address, etc., it should be highlighted. When the user click again on that highlighted string, it should be unhighlight. How to achieve this in Flex 3? I would like to do this using datagrid and dataprovider.
