It consists of numerous tools for configuring the core elements of InfoPath: creating form templates, workflows, workbook templates, data sources, calculations, and formula modules. Its wizards are designed to help installers create and customize forms. Forms can be made from scratch without using a template. You can set the location of a file that contains a form, and define multiple forms from a single XSLT form template. You can also publish and distribute an InfoPath form from within your InfoPath workspace and publish it to your server. You can also take a template, make changes, and combine it with other templates. You can create wizards to automate the installation process or to create additional wizards. You can build your own, and you can use common wizards that Microsoft provides for you, or you can configure them to meet your specific needs. You can create form styles for your InfoPath forms, whether you use the static presentation feature to generate the form from a C# code file or a XSLT form template. You can create and customize an entire form with a workflow. Workflows are used to guide the user through the different data entry, calculation, and database functions. Workflows include many controls, such as a Field List, a Conditional Renderer, validation controls, and quick controls. You can add data to InfoPath forms. Data can be saved in a database, exported to files, inserted into code files, or uploaded to Web services. You can create custom tables and queries in a database that you can store on your computer. In addition, you can create code files, which contain C# code and XSLT code. You can configure the collection of data to include, exclude, and merge selections. You can also automatically fill out data in the form when users click on buttons and other controls. You can validate form data, and you can include any additional validation controls that you require, such as a regular expression control. The Info
